

# SLU DSS: Git & GitHub

Christopher Prener, Ph.D.

September 12, 2019

## Basic Workflow

### Workflow Tips:

Keep only one (and only one!) local copy of each repo, commit changes early and often, check GitHub.com after pushing if you want to ensure things worked!

### *Basic Bash Commands*

```
$ cd [.]
```

Change working directory.

### *Basic Git Commands*

```
$ git init [repo-name]
```

Creates a new local repository.

```
$ git clone [url]
```

Creates a new local repository with the specified name.

```
$ git status
```

List all new or modified files to be committed.

```
$ git add [-A] [file-name]
```

Snapshots (or “stages”) the file (or all files with -A) for versioning.

```
$ git reset [file-name]
```

Unstage the file.

```
$ git commit -m "[message text]"
```

Records file snapshots permanently in version history.

```
$ git push [alias] [branch-name]
```

Upload all local changes to GitHub; the alias is typically origin.

```
$ git pull
```

Downloads history and updates repository.

```
$ git branch [branch-name]
```

Create a new branch.

```
$ git checkout [branch-name]
```

Switch to the specified branch.
